Table 11. Top 20 bulls for 200-day weight	16
f. Rearing traits.....	17
Table 12. Top 20 bulls for age at weaning.....	17
g. Calving traits (sires of progeny born 2021 or earlier).....	18
Table 13. Top 20 bulls for gestation length	18

Introduction

The Dairy Beef Progeny Test began at Limestone Downs in 2015, where Hereford and Angus bulls with a range of EBVs were tested in a dairy herd to determine how well the progeny performance matched the EBV of the sire. The EBVs proved to be a good predictor of performance in the dairy beef system, and so the second stage of the Dairy Beef Progeny Test was established at Pāmu’s Renown farm at Wairakei Estate. In this test, bulls of any breed for which the EBV indicated they were likely to be excellent bulls for dairy beef systems are selected and Progeny Tested through the generation of calves in the Renown dairy herd. Calves are reared under commercial conditions and finished at Pāmu’s Orakonui farm at Wairakei Estate.

The 2019-born calves from Renown were processed between October 2021 and March 2022. The 2020-born calves have been measured up to 600-day weight and will be ultrasound scanned and processed in 2022/23. The 2021-born calves have been measured up to 200-day weight. A new cohort of calves is expected in spring 2022, and we will shortly be calling for nominations for the 2022 mating to produce the 2023-born cohort.

The first part of this report provides updates on the latest traits recorded for each cohort, including the second birth-to-carcase performance data on bulls tested at Renown. The second part of this report identifies some top all-round bulls that can be used to the benefit of all players in the industry. In addition, top individual bulls for key traits are identified.

PART 1. COHORT UPDATES

2021-born calves: birth, rearing and growth traits up to 200 days of age

See Table 1, Page 5

Nine hundred and thirty-five calves were DNA-verified to Progeny Test sires in spring 2021. Once again, there was no problem with calving difficulty. There were 16 assisted calvings, all of which involved a mal-presented calf, only one of which required veterinary assistance. The mean birth weight was consistent with previous seasons. Calves were reared on-farm at Pāmu and weaned at a mean live weight of 85 kg.

These calves have been recorded up to 200-day weight, and their next measurement will be a 400-day weight in Spring 2022.

2020-born calves: 400-day and 600-day weight

See Table 2, Page 6

The 2020-born calves have been run in four groups since weaning (two of heifers, two of steers), are on track for processing in the coming spring/summer and will have ultrasound data collected prior to processing.

2019-born calves: Carcase traits assessed by ultrasound and at processing

See Table 3 and Table 4, Pages 7-9

These cattle were managed in four herds from weaning until near to processing, when three of the four groups were split into two subgroups for processing. This resulted in three groups of heifers and four groups of steers at processing. All heifer groups were ultrasound scanned prior to processing of the first heifers, and all steer groups were ultrasound scanned at a later event, prior to processing of the first steers. The average age at ultrasound scanning was 844 days, and the average age at processing was 863 days.

All the traits assessed in the live animals have shown a significant impact of sire – meaning that the progeny performance was better for some sires than others. When carcase traits were considered, we identified two traits – pH and meat colour – that were not affected by sire. Overall, 4% of cattle processed from the 2019-born cohort had a pH of 5.8 or more.

The majority of cattle (93.1%) graded P2, 6% graded L2 and 0.55% graded P3. Fat colour scores of 5 or above are likely to result in downgrading for yellowness. Overall, 5.1% of cattle processed from the 2019-born cohort reached this threshold for yellowness. Cattle were processed through Silver Fern Farms Pacific Plant, where they were assessed on the Beef EQ standard; 35.2% of heifers and 31.3% of steers processed reached the reserve grade.

Table 1. Cohort 6 (2021-born calves): Average gestation length, birth weight, weaning age and 200-day weight of sires.

*Ossification was measured for the first time on 2018-born calves, but the number of progeny reported includes those born in previous cohorts for the link sires.

PART 2. TOP PERFORMING BULLS ACROSS COHORTS:

a. All-round performance from birth-carcase (sires of progeny born 2019 or earlier).

The ideal bull for dairy beef must produce a calf that is born easily and on-time, and that calf must then grow quickly to weaning, and then to processing, producing a good level of fatness in the carcase.

There are twelve bulls in the Progeny Test (within those for which carcase data has already been collected), that meet the following criteria: birth weight less than 40 kg, gestation length no more than 282 days, weaning age below average, carcase weight and marbling score above average.

Table 5. Bulls with lifetime progeny data that meet the “all-rounder” criteria - having good birth weight, gestation length, age at weaning, carcase weight and marbling score.

Sire Name	Breed	Herdbook number	Gestation length (days)	Birth weight (kg)	Weaning Age (days)	200-day weight (kg)	400-day weight (kg)	600-day weight (kg)	Ultrasound EMA (cm ²)	Carcase weight (kg)	MSA marbling score

Note: Bulls are listed alphabetically within breed. Rissington Protégé 110002 was used at Limestone Downs only and does not have ultrasound records on his progeny. Bulls with values highlighted indicate they are within the top 20% of tested bulls for that trait.

Table 6. All round performance of up-and-coming sires (sires of progeny born 2020 or 2021).

For bulls that do not have progeny old enough for processing yet, live weight at 600 days (2020-born) or 200 days (2021-born) was considered in place of carcass traits. There are nine bulls in the Progeny Test that meet the following criteria: birth weight less than 40 kg, gestation length no more than 282 days, 600-day weight (2020-sires only) or 200-day weight (2021-sires only) above average.

Sire Name	Breed	Herdbook number	Gestation length (days)	Birth weight (kg)	Weaning Age (days)	200-day weight (kg)	400-day weight (kg)	600-day weight (kg)

*Bulls used at Limestone Downs only do not have ultrasound records on their progeny. Bulls with progeny born in 2020 or 2021 do not have a full record yet.

f. Rearing traits

Age at weaning has a significant impact on the cost of rearing calves.

Table 12. Top 20 bulls for age at weaning (for bulls that have had at least 10 progeny reach weaning).

Sire Name	Breed	Herdbook number	Gestation length (days)	Birth weight (kg)	Weaning Age (days)	200-day weight (kg)	400-day weight (kg)	600-day weight (kg)	US* EMA (cm ²)	Carcase weight (kg)	MSA marbling score	Rib fat Depth (mm)
